Determination of vitamin C in vegetable products by a kinetic method

Paragraph 2480 **Hygiene and Sanitation, Moscow 1949, 8 (26-30) Tables I**
Since various known methods for the determination of vitamin C are unsuitable in many cases, a new method proposed by Okolov was examined and found satisfactory. The method is based on the kinetics of oxidation of potassium iodide by ascorbic acid. The procedure, modified by the author, consists in preparing an extract of ascorbic acid from 10 g. of vegetable material, which is ground with 5 g. of quartz sand and 30 ml. of a 20% solution of hydrochloric acid; after 10 minutes' standing the extract is filtered through gauze and 10 ml. of filtrate placed in a 250 ml. flask, in which were previously mixed 80 ml. of distilled water at 18°C., 5ml. of 100% sulphuric acid, 2 ml. of a 5% potassium iodide solution (iodine-free) and 3 ml. of 1% soluble starch. Finally there is added 1 ml. of 1% hydrogen peroxide (concentration checked daily by titration with 0.1 n-KMnO₄), and the time required for the appearance of a blue is colour-measured with a stop watch. The temperature is then recorded within $\pm 0.2^\circ\text{C}$. After addition of a few drops of 0.01 n-sodium hyposulphite the reaction mixture is decolorized and the time which passes to a second appearance of blue of the same intensity is again measured; this procedure is repeated three times. For calculation, the mean value of the three latter measurements is reduced to reaction velocity at 18°C. by addition or subtraction of 10% of its value for each degree above or below 18°C. respectively. The resulting value is multiplied by 3×0.0077 . The results were compared with those obtained by the standard method of titration

Title : The Influence of Histidine on the Development of Experimental Atherosclerosis.

Orig Pub : Tr. In-ta klinich. i experim. cardiol. An GruzSSR, 1956
(1957) 4, 347-360

Abstract : The experiments were carried out on rabbits. The first group of animals received cholesterine (1) for 45 days and then 1 with histidine (11) for an additional 20 days. A second group received (1) for 3 months and then 1 and 11 during an additional 3 months. A third received 1 and 11 simultaneously. The administration of 11 in rabbits with acute hypercholesteremia decreased cholesterine, calcium and sympathin content, brought to normal the quantity of Mg in the blood, and normalized the reactions of the blood circulation apparatus. In animals, receiving 1 and 11 since the beginning of the experiments,

TITLE: Fast-Drying Binding Materials Based on Sulfite-Alcohol Distillation Waste, Type CM-1 (SM-1)

PERIODICAL: Liteynoye proizvodstvo, 1960, No. 12, pp. 10 - 11

TEXT: In cooperation with the Institute of Plastics under the supervision of A.M. Lyass, the TsNIITMASH has developed a new core binding agent (SM-1), by mixing sulfite-alcohol distillation waste with a small amount of technical carbamide. The new binding agent has the same strength and technological properties as the binding material, consisting of the condensation products of carbamide, formaldehyde and sulfite-alcohol distillation waste (MCB - MSB), developed some time ago by the same institutes, only the SM-1 binding agent can be obtained by a simpler method than the MSB type and does not have the disagreeable smell of this product. The SM-1 binding agent is produced by sprinkling technical carbamide in sulfite-alcohol distillation waste and by stirring until a uniform solution is formed. The optimum strength and technological properties required are obtained by mixing sulfite-alcohol distillation waste and carbamide in a 5 : 1 ratio. Max-

CM-1 (SM-1)

imum strength will be obtained with the sulfite-alcohol distillation waste having a specific weight of 1.26 - 1.27 (Fig. 2). With a specific weight under 1.25, the viscosity of the solution decreases, its liquidity improves, but its strength decreases both in humid and in dry condition. By increasing the amount of the binding agent, the strength of dry samples increases and a maximum specific strength is attained with a content of 5% binding agent in the mixture. The influence of clay in the mixture has also been tested. The increase in clay content raises the strength of the binding agent when wet. In the dry samples, an addition up to 3% of clay increases the strength, more than 3% of clay lowers the strength, however. The optimum composition with regard to strength is: 96 - 98; clay 2 - 4; binding agent 5.0 parts by weight. The influence of the drying temperature on the samples was also tested and it was found that the samples would dry in the temperature range 180 - 220°C, but the best indices were obtained with drying at 200°C (Fig. 4). Strength begins to develop already after 3 - 4 min of drying and the maximum strength is obtained after 7 - 10 min. However, the cores having much larger dimensions than the samples, require longer drying: smaller cores about 25 - 35 min, medium sized ones 1.5 - 2 h and large ones 3.5 - 4 h, in

Card 2/5

CM-1 (SM-1)

drying furnaces. The hygroscopicity of the mixture can be reduced by adding petroleum-bitumen, diluted with white spirit or kerosine in a 1 : 1 ratio. The cores can easily be shaken from the castings. In another production-variant for this kind of binding agent carbamide is dissolved in water (up to a 1 : 1 ratio) instead of in the sulfite-alcohol distillation waste (the solution contains 55% water and 45% carbamide). The grinder is filled in the following sequence: sand, clay, sulfite-alcohol distillation waste (specific weight minimum 1.28), and at last, the aqueous solution of carbamide. This process is simpler than the former and, due to the somewhat greater humidity of the mixture, the clay content can be increased. This raises the strength of the mixture at high temperatures. For instance, if the compression strength of the mixture is 4.9 kg/cm² at 600°C and 3.1 kg/cm² at 800°C, the strength increases to 15 kg/cm² at 600°C and 10 kg/cm² at 800°C, when adding 5% clay. The new agent was practice-tested in the Kolomensk Diesel Factory imeni Kuybyshev in the production of crankshaft forms and cylinder block cores for of large diesel engines with the following composition: sand 96.0; refractory clay 3.5; binding agent 5.0; bitumen solution 1.0 by weight (bitumen No. 5 with white spirit 1 : 1 ratio was used). The compression strength

Card 3/5

Fast-Drying Binding Materials Based on Sulfite-Alcohol Distillation Waste, Type
CM-1 (SM-1)

of the samples obtained with the mixture in wet condition was 0.10 - 0.18 kg/cm², while the tensile strength in dry condition was 12 - 16 kg/cm². The humidity of the samples was 2.0 - 2.5%, their gas-permeability 100. The drying time when using the new binding agent was reduced for the above products from 13 to 6 h, the time for producing the mixture was shortened 1.5 - 2 times. The new binding agent was also tested in the manufacture of various other products and also in mass-production in the Moscow Automobile Factory imeni Likhachev. It was found, in general, that the drying time of cores can be reduced by about 50% when this new binding material is used. Some compositions recommended are:

Quartz sand	Refractory clay	Binding agent	Bitumen solution
100 - 98.5	0 - 1.5	4 - 5	0.5 - 1.0
98.5 - 97.0	1.5 - 3.0	3.5 - 4.0	1.0
97.0 - 96.0	3.0 - 4.0	4 - 5	1.0

Black sand up to 30% and 1% of water can be used. All values stand for parts by weight. There are 4 figures and 1 table.

Title :

Contribution to the Problem of Principally Utilized
Fellings in the Fir Tree Stands of Rudnyy Altay.

Orig Pub : Izv. AN KazSSR. Ser. Biol., 1957, vyp. 1, 49-65.

Abstract : A detailed analysis is made of the study of natural renewal under the fir tree canopy and in the clearings of Leninogorsk and Cheremshanka timber tracts in East Kazakhstanskaya Oblast'. It is noted that vegetative reproduction takes place partially in the fir through down-falling branches taking root. A obstacle to the successful renewal of fir in glades is the hectic growth of grassy vegetation and the absence of seed producers. An analysis is made of the various types of fellings from the point of view of natural renewal, the protective features of the forest and

TITLE: Concerning ultrasonic wave propagation in nonaqueous solutions of electrolytes

PERIODICAL: Referativnyy zhurnal, Fizika, no. 11, 1961, 330-331, abstract 11Zh569 ("Uch. zap. Buryatsk. gos. ped. in-t", 1960, no. 19, 61-72)

TEXT: Ultrasonic velocities were measured in nonaqueous solutions of electrolytes. Monatomic methyl, ethyl, propyl and isopropyl alcohols were selected as solvents, while NaI was selected as the solute. In contrast to aqueous solutions ultrasonic velocity in nonaqueous solutions varies linearly with concentration, i.e. in the same way as in liquid mixtures. The author assumes that the similarity of the acoustic properties of nonaqueous solutions of electrolytes and liquid mixtures is due to the fact that in both cases Van der Waals forces play the basic role in potential interaction. There are 17 references.

Title : An Evaluation of Hemostatic Action of a Rumanian Drug Thrombin in Capillary Haemorrhages.

Orig Pub : Probleme zootehn. shi veterin. 1956, No 5, 75075

Abstract : Rumanian thrombin is a derivative from the group of acridine compounds. It was administered in the form of a 2% suspension in a physiological solution or serum on the basis of 6.6mg/100kg. It induced a precise change in the period of coagulation; it had no effect in therapeutic doses on temperature, respiration and pulse. Maximum effect took place three hours following administration. It may be used as a local hemostatic in operational wounds.

41. LIGHT NON-SECTIONAL SHIELD. Chirakal, M.A. (Ugol (Coal), Feb. 1954, 22-24). An illustrated description is given of a roof support used for seams dipping at 55° and above in southern Kuzbass. It is built up of (e.g.) 36 mm diameter spars 4.5 m long partially squared and clamped between lengths of steel channels to form a ceiling 32 m long and 4.5 m wide. It is much lighter and cheaper than the previous type and its use led to increased output. (L).

TITLE:

The First Congress of the Scientific Engineering Society of the Instrument Building Industry

PERIODICAL:

Izmeritel'naya tekhnika, 1959, Nr 7, p 54 (USSR)

ABSTRACT:

The First Conference of the Nauchno-tekhnicheskoye obshchestvo priborostroitel'noy promyshlennosti (Scientific Engineering Society of the Instrument Building Industry) was convened in Moscow from May 15-16, 1959. About 109 delegates from 231 primary organizations of the society, united in 14 republic and oblast' NTO directorates, participated in the conference. The chairman of the Central Directorate, Doctor of Technical Sciences, Professor A.N. Gavrilov, reviewed the activity of the society members in developing improvements for the work of the Soviet instrument-building industry. He mentioned some of the most active primary organizations: "Tochomskpribor", "Niichasprom" and others. During the past three years, 26 competitions were held in which 1,194 society members participated. Most suggestions in these competitions were made by scientists and engineers. Out of a total of 522 sug-

The First Congress of the Scientific Engineering Society of the Instrument Building Industry

gestions, 237 received awards. Experiences in instrument building were exchanged between the USSR and foreign countries when NTO Priborprom represented the USSR at the First International Conference on Measuring Instruments, IMEKO in Budapest in 1958. The speeches of the conference participants dealt with problems of developing the instrument industry in USSR republic-and industrial centers. The conference participants suggested improvements in the work of the society. In some cases the introduction of suggestions is neglected and industrial installations receive inadequate assistance from scientific, engineering and design organizations as well as educational institutions. The conference participants accepted a number of recommendations dealing with the future activity of the society. The draft of the statute of the Scientific Society of the Instrument Building Industry was discussed and approved.

TITLE: Geoelectric prospecting device. Class 21, No. 184361 [announced by All-Union Scientific Research Institute of Geophysical Prospecting Methods (Vsesoyuznyy nauchno-issledovatel'skiy institut geofizicheskikh metodov razvedki)]

SOURCE: Izobret prom obraz tov zn, no. 15, 1966, 62

TOPIC TAGS: prospecting, geologic instrument

ABSTRACT: This Author Certificate presents a geoelectric prospecting device containing a dc generator, a master oscillator, a thyatron bridge commutator, a reference phase synchropulse shaper unit, a radio station, and a measuring laboratory. The laboratory contains an electromagnetic field receiver, a calibration unit, a selective amplifier, a radio station, a synchropulse shaper unit, an electronic oscillograph, a recorder, a time setting unit, and a detector voltmeter. For generalized utilization of the device in the VP, MPP, and INFAZ methods, to increase the accuracy of measuring the phase angles in the infrasonic frequency range, and to increase the noise

protection when measuring pulsed signals, a phase marker in the form of a diode regenerative comparator is placed in the measuring laboratory. The comparator is connected to the output of the selective amplifier. An input signal divider connected to the input of the selective amplifier is used in the calibration unit. A dc amplifier operating in the electrometric mode is connected between the register and recorder (see Fig. 1).

Color Variation of the Codfish *Morhua morhua* L. (Individual and in Shoal) in Dependence on the Background
(Izmeneniye okraski *Gadus morhua morhua* L. (odinochnoy i v staye) v zavisimosti ot fona)

PERIODICAL:

Doklady Akademii nauk SSSR, 1959, Vol 126, Nr 3, pp 667-670 (USSR)

ABSTRACT:

As is known, the skin color of many kinds of fish is not constant. It can change according to the point of time within the cycle of life, the physiological state and age. Some influence is also exerted by the oxygen content of water and the type of nourishment (Ref 1). The most frequent reason for a color variation of fish is an adaptation to the surrounding background (Refs 2-6). The present paper gives some indications in the sense of the title, as well as on the rate of this process and on the differences in color variation for individuals and a group of fish. The fishes were caught in the Dal'ne-Zelenetskaya Gulf. They were from the current year (6-10 cm long) up to the age of 5 years (Table 1). The larger fish were kept in ordinary, dull-white bathing-tubs, they felt

very well, nourished themselves and lived up to 2 months. A 9-number scale was used for recording the color variation. The test results confirmed the known color variation according to the background. Table 2 and figure 1 show the results of brightening of fish. The results obtained with large fish can be summarized as follows: 1. An individual of codfish placed against a white or dark background assumes very quickly the color of the corresponding background; a fish within a group of other individuals on the same background does not change its color.- 2. Dark-colored codfish constitutes a more efficient factor than the white background, both for an individual and for a group of bright-colored fish.- 3. The influence of abiotic and biotic factors is exerted by means of the visual faculty.

SOV/20-126-3-58/69

Small fish become bright on a white background and dark on a black one, independent of whether they are individual or in a group. There are 1 figure, 2 tables, and 6 references, 2 of which are Soviet.
